**RECORDS OF WELLS, DRILLERS' LOGS, AND
CHEMICAL ANALYSES OF GROUND WATER
IN GALVESTON COUNTY, TEXAS, 1952-1970**

INTRODUCTION

The collection of hydrologic data for an intensive ground-water study in Galveston County, Texas, was begun by the U.S. Geological Survey in 1938. The program was interrupted during World War II, but periodic water-level measurements were made during the war years. In 1950, the cooperative program of investigation was renewed. The current program is carried out in cooperation with the Texas Water Development Board and the city of Galveston. All wells in Galveston County draw water from the Gulf Coast aquifer.

This report contains the records of 97 wells and test holes, 60 drillers' logs, and 652 chemical analyses of water samples collected since 1952. Barnes (1941) and Petitt and Winslow (1955) recorded data collected earlier. Additional data relative to 42 wells recorded by Petitt and Winslow has since been collected. A cross-reference of numbers assigned to these wells is given in Table 1. The records of wells and test holes are given in Table 2, the drillers' logs in Table 3, and the chemical analyses in Table 4. The locations of wells for which data appear in this report are shown on Figure 1.

Data on the geology, hydrology, pumpage, and chemical quality of ground water may be obtained from the previous publications (Barnes, 1941; Gabrysch, 1967; Petitt and Winslow, 1955; Wood and Gabrysch, 1965). Measurements of water levels in wells for the period 1894-1969 were compiled by Gabrysch, McAdoo, and Bonnet (1970).

WELL-NUMBERING SYSTEM

The well-numbering system used in this report was devised by the Texas Water Development Board for use throughout the State. Under this system, each 1-degree quadrangle is given a number consisting of two digits. These are the first two digits in the well number. Each 1-degree quadrangle is divided into 7½-minute quadrangles which are given 2-digit numbers from 01 to 64. These are the third and fourth digits of the well number. Each 7½-minute quadrangle is divided into 2½-minute quadrangles which are given a single digit number from 1 to 9. This is the fifth digit of the well number. Finally, each well within a 2½-minute quadrangle is given a 2-digit number in the order in which it was inventoried, starting with 01. These are the last two digits of the well number.

On the well-location map (Figure 1), only the last three digits of the well number are shown at each well location; the second two digits are shown in the northwest corner of each 7½-minute quadrangle; and the first two digits are shown by the large block numerals 64 and 65.

In addition to the 7-digit well number, a 2-letter prefix is used to identify the county. The prefix for Galveston County is KH.

Table 2.-Records of Wells and Test Holes in Galveston County

This table does not include those wells listed in Table 1 which are described by Petitt and Winslow (1955); however, chemical analyses for those wells are included in Table 4.

All wells are drilled unless otherwise noted in remarks column.

Water level : Reported water levels given in feet; measured water levels given in feet and tenths.

Method of lift and type of pump: A, airlift; Cf, centrifugal; E, electric; J, jet; N, none; Ng, natural gas; Sub, submersible; T, turbine.

Use of water : D, domestic; Ind, industrial; Irr, irrigation; N, none; P, public supply; S, livestock.

¹ Analysis by commercial laboratory - dissolved solids calculated.² Sample may not be representative - well pumped 10 minutes.

* Sodium and potassium calculated as sodium (Na).

+ Bicarbonate (HCO₃) plus carbonate (CO₃).
