VOLUMETRIC SURVEY REPORT

ON AQUILLA LAKE

SURVEY OF APRIL 2002

INTRODUCTION

Staff of the Surface Water Availability Section of the Texas Water Development Board (TWDB) conducted a volumetric survey of Aquilla Lake during the period of April 9, 2002 through April 18, 2002. The primary purpose of the survey was to determine the current volume of the lake at conservation pool elevation (CPE) 537.5 ft. For the purpose of this report, the term “top of conservation (TOC) pool” will be used to mean the conservation pool elevation (537.5 ft) for Aquilla Lake. The results of the current survey will be compared to the baseline survey performed by TWDB in October of 1995, report date January 1996. Results from a sediment survey will be presented in a later report. Survey results are presented in the following pages in both graphical and tabular form.

The vertical datum used during this survey is that used by the United States Geological Survey (USGS) for the lake elevation gage at Aquilla Lake. The station number and name is 08093350 Aquilla Lake above Aquilla, TX. The datum for this gage is reported as sea level (USGS, 2002). Thus, elevations are reported here in feet (ft) above sea level. Volume and area calculations in this report are referenced to water levels provided by the USGS gage.

Original design information for Aquilla Lake was based on information furnished by U.S. Army Corps of Engineers. The equipment and methodology used in the current

survey was similar to that used in the October 1995 survey. Please refer to the Volumetric Survey of Aquilla Lake (TWDB 1996) for more information.

TABLE 1. AQUILLA DAM AND AQUILLA LAKE PERTINENT DATA

Owner of Dam and Facilities:

U.S. Army Corps of Engineers

Operator of Dam and Facilities:

U. S. Army Corps of Engineers, Fort Worth District

Engineer and General Contractor

U. S. Army Corps of Engineers (Design)

Clearwater Construction (General Contractor)

Location:

Aquilla Lake is located in Hill County, on Aquilla Creek, a tributary of the Brazos River, downstream of the confluence with Hackberry Creek, approximately seven miles southeast of Hillsboro, TX. (Figure 1).

Purpose:

Multi-purpose reservoir for flood control, water supply, fish and wildlife enhancement, and general recreation.

Authorization:

Federal: Federal Flood Control Act 1968, Public Law 90-483, 90th Congress approved August 13, 1968.

State: Certificate of Adjudication 12-5158 was issued by the Texas Water Commission December 14, 1987 to the Brazos River Authority (BRA) to impound 52,400 ac-

ft of water at elevation 537.5 in an existing reservoir on Aquilla Creek. The BRA was authorized a priority right to divert and use not to exceed 13,896 ac-ft of water per annum for municipal, industrial and mining purposes. For the purposes of the system operation, the BRA was authorized to exceed the priority right and annually divert and use from Aquilla Lake not to exceed 17,000 ac-ft for municipal purposes; 18,200 ac-ft for industrial purposes and 200 ac-ft for mining purposes. Any diversions and use of water from Aquilla Lake in excess of 13,896 ac-ft of water in one calendar year would be charged against the sum of the amounts designated as priority rights in other reservoirs included in the System Operation Order. BRA was also authorized to use the water impounded in Aquilla Lake for non-consumptive recreation purposes. Certificate of Adjudication 12-5167 (issued December 14, 1987) states the BRA is authorized to divert and use not exceed, 30,000 ac-ft of water for municipal purposes and 170,000 ac-ft of water for industrial purposes, to be used in the San Jacinto-Brazos Coastal Basin. These waters are to be released from Aquilla Lake and other reservoirs owned and operated by the Brazos River Authority.

Drainage area:

255 square miles

Dam:

Type	Rolled earth fill
Length	11,890 ft
Maximum height	104.5 ft (above natural streambed)

Spillway:

Type	Concrete, ogee weir
Control	Uncontrolled
Length	1,200 ft

Outlet works:

Type	Gated conduit
------	---------------

Dimensions	Conduit 10 ft diameter
Floodgate invert elevation	503.0 ft
Control	Two 4.5 ft wide x 10 ft high sluice gates with hydraulic control

Existing Reservoir Data:

FEATURE	ELEVATION (Feet)	CAPACITY (Ac-ft)	AREA (Acres)
Top of Dam ¹	582.5	-----	-----
Maximum Design Water Surface ¹	577.5	359,900	14,495
Top of Flood Control Storage Space ¹	556.0	146,000	7,000
Spillway Crest ¹	564.5	213,800	8,980
<hr/>			
Top of Conservation Storage Space ²	537.5	45,962	3,266
Invert of Lowest Intake ²	503.0	291	142
Usable Conservation Storage Space ²	537.5	45,671	-----

1. Information at elevations above 537.5 ft from Aquilla Lake Design Memorandum No. 3, 1975 by the U.S. Army Corp of Engineers.

2. Information at elevation 537.5 ft and below based on 1996 area and capacity data provided to the U.S. Army Corp of Engineers by the Texas Water Development Board.

VOLUMETRIC SURVEYING TECHNOLOGY

The equipment used to perform the latest volumetric survey consisted of a 23-foot aluminum tri-hull SeaArk craft with cabin, equipped with twin 90-Horsepower Honda outboard motors. (Reference to brand names throughout this report does not imply

endorsement by TWDB). Installed within the enclosed cabin are a Coastal Oceanographics' Helmsman Display (for navigation), an Innerspace Technology Model 449 Depth Sounder and Model 443 Velocity Profiler, Trimble Navigation, Inc. AG132 GPS receiver with Omnistar differential GPS correction signal and PC. A water-cooled 4.5 kW generator provides electrical power through an in-line uninterruptible power supply. In shallow areas and where navigational hazards such as stumps were present, a 20-foot aluminum shallow-draft flat bottom SeaArk craft with cabin and equipped with one 100-horsepower Yamaha outboard motor was used. The portable data collection equipment on-board the boat included a Knudsen 320 B/P Echosounder (depth sounder), a Trimble Navigation, Inc. AG132 GPS receiver with Omnistar differential GPS correction signal and a laptop computer.

The GPS equipment, survey vessel, and depth sounder in combination provide an efficient hydrographic survey system. As the boat travels across the pre-plotted transect lines, the depth sounder takes approximately ten readings of the lake bottom each second. The depth readings are stored on the computer along with the positional data generated by the boat's GPS receiver. The data files collected are downloaded and transferred to the office for editing after the survey is completed. During editing, poor-quality data is removed or corrected, multiple data points are averaged to one data point per second, and the average depths are converted to elevation readings based on the water-level elevation recorded on the day the survey was performed. Accurate estimates of the lake volume can then be determined by building a 3-D TIN model of the lake from the collected data.

PRESURVEY PROCEDURES

The lake's boundary was digitized using Environmental Systems Research Institute's (ESRI) ArcGIS from digital orthophoto quadrangles (DOQ's). VARGIS of Texas LLC produced the DOQ's for the Texas Orthoimagery Program (TOP). The

DOQ's produced for the Department of Information Resources and the GIS Planning Council under the TOP reside in the public domain. More information can be obtained on the Internet at <http://www.tnris.state.tx.us/DigitalData/doqs.htm>. The lake elevation, at the time the DOQ's were photographed (January 31, 1995) was 537.87 ft. The lake and island boundaries were given an elevation of 537.9 ft and TWDB Staff utilized these updated boundary conditions in modeling Aquilla Lake for this report. The lake elevations varied between elevation 539.15 ft and 538.09 ft during the survey (April 09, 2002 – April 18, 2002).

The survey layout was designed by placing survey track lines at 500-foot intervals within the digitized lake boundary using the HYPACK software. The survey design required the use of approximately 155 survey lines placed perpendicular to the original river channel and tributaries along the length of the lake.

SURVEY PROCEDURES

The following procedures were followed during the volumetric survey of Aquilla Lake performed by the TWDB. Information regarding equipment calibration and operation, the field survey, and data processing is also presented.

Equipment Calibration and Operation

Prior to collecting data onboard the Hydro-survey boat, the depth sounder was calibrated with the Innerspace 443 Velocity Profiler, an instrument used to measure the variation in the speed of sound at different depths in the water column. The average speed of sound through the entire water column below the boat was determined by

averaging local speed-of-sound measurements collected through the water column. The velocity profiler probe was first placed in the water to acclimate it. The probe was next raised to the water surface where the depth was considered zero. The probe was then gradually lowered on a cable to a depth just above the lake bottom, and then raised again to the surface. During this lowering and raising procedure, local speed-of-sound measurements were collected, from which the average speed was computed by the velocity profiler. This average speed of sound was entered into the ITI449 depth sounder, which then provided the depth of the lake bottom. The depth was then checked manually with a measuring tape to ensure that the depth sounder was properly calibrated and operating correctly.

While collecting data onboard the River Runner (shallow draft) boat, the Knudsen depth sounder was calibrated using the DIGIBAR-Pro Profiling Sound Velocimeter by Odem Hydrographic Systems. The steps to determine the speed of sound are similar to those used for the Innerspace 443 Velocity Profiler. The probe was first placed in the water to acclimate it, raised to the water surface where the depth was considered zero. The probe was then gradually lowered on a cable to a depth just above the lake bottom, and then raised again to the surface. During this lowering and raising procedure, local speed-of-sound measurements were collected, from which the average speed was computed by the velocimeter. The speed of sound was then entered into the bar check feature in the Knudsen software program. The depth was then checked manually with a stadia (survey) rod or weighted measuring tape to ensure that the depth sounder was properly calibrated and operating correctly.

The speed of sound in the water column was 4810 feet per second during the Aquilla Lake survey. Based on the measured speed of sound for various depths and the average speed of sound calculated for the entire water column, the depth sounder is accurate to within ± 0.2 ft. An additional estimated error of ± 0.3 ft arises from variation in boat inclination. These two factors combine to give an overall accuracy of ± 0.5 ft for

any instantaneous reading. These errors tend to be fairly minimal over the entire survey, since some errors are positive and some are negative, canceling each other out.

During the survey, the horizontal mask setting on the onboard GPS receiver was set to 10 degrees and the PDOP (Position Dilution of Precision) limit was set to seven to maximize the accuracy of the horizontal positioning. An internal alarm sounds if PDOP rises above seven to advise the field crew that the horizontal position has degraded to an unacceptable level. Further positional accuracy is obtained through differential corrections from the Omnistar receiver. The lake's initialization file used by the HYPACK data collection program was set up to convert the collected Differential GPS positions to NAD 83, State Plane, Texas Central Zone coordinates on the fly.

Data Collection

TWDB staff collected data at Aquilla Lake for approximately 3 days during the period of April 9, through April 18, 2002. The USACE were able to maintain the lake levels above TOC during the survey. The lake level elevations varied between 538.09 ft and 539.15 ft, thus allowing the survey crew to collect data in most areas of the lake that would be inundated at TOC 537.5 ft.

The design layout for collecting data at Aquilla Lake required pre-plotting transects (range lines) that were perpendicular to the old river and creek channels. These transects had an average spacing of 500 ft. While collecting data, the boat operator would steer the boat on course (with GPS navigation) starting from one shore and heading to the opposite shore. The data collector would monitor the data display and depth sounder to make sure the latitude; longitude and depth (x,y,z) values were being logged. Adjustments could be made if the instruments were receiving bad data at that time. The depth sounder and GPS equipment records 10 data points every second. These

points are averaged to one data point per second for generating the model. The distance between data points depended on the speed of the boat. The maximum distance between data points during the 2002 survey of Aquilla Lake was approximately 30 ft.

Approximately 43,000 data points were collected over the 81 miles traveled during the data collection phase of Aquilla Lake. These points were stored digitally on the boat's computer in 181 data files. Random data were collected in those areas where the crew was not able to stay on course due to obstructions. Data were not collected in areas with significant obstructions or where the water was too shallow. Figure 2 shows the actual location of all data points collected.

Data Processing

The collected data were downloaded from diskettes onto TWDB's network computers. Tape backups were made for future reference as needed. To process the data, the EDIT routine in the HYPACK Program was run on each raw data file. Data points such as depth spikes or data with missing depth or positional information were deleted from the files. A correction for the lake elevation at the time of data collection was also applied to each file during the EDIT routine. After all adjustments had been made to the raw data files, the edited files were saved. The edited files were then combined into a single X, Y, Z data file, to be used with the GIS software to develop a model of the lake bottom elevation.

The resulting data file was imported into Environmental System Research Institute's (ESRI) Arc/Info Workstation GIS software. This software was used to convert the data to a MASS points file. The MASS points and the boundary file were then used to create a Digital Terrain Model (DTM) of the lake's bottom surface using Arc/Info's

TIN software module. The module generates a triangulated irregular network (TIN) from the data points and the boundary file using a method known as Delauney's criteria for triangulation. A triangle is formed between three non-uniformly spaced points, including all points along the boundary. If there is another point within the triangle, additional triangles are created until all points lie on the vertex of a triangle. All of the data points are used in this method. The generated network of three-dimensional triangular planes represents the bottom surface. With this representation of the bottom, the software then calculates elevations along the triangle surface plane by determining the elevation along each leg of the triangle. The lake area and volume can be determined from the triangulated irregular network created using this method of interpolation.

Volumes and areas were calculated from the TIN for the entire lake at one-tenth of a foot interval from the lowest elevation to the contour used for the lake boundary during the current survey. From elevation 493.7 ft to 537.5 ft, the surface areas and volumes of the lake were computed using Arc/Info software. The computed lake volume table is presented in Appendix A and the area table in Appendix D for Aquilla Lake. The lake volume and area tables as originally reported in the 1996 Volumetric Survey of Aquilla Lake are presented in Appendix B and Appendix E. The 1996 lake volume and area tables were revised using the updated boundary conditions developed from 1995 photographs are presented in Appendix C and Appendix F. An elevation-volume graph and an elevation-area graph are presented in Appendix G and Appendix H respectively. Finally, endpoint coordinates for 18 range lines can be found in Appendix I. The range line plots for the three TIN models are presented in Appendix J.

The current survey shows an increase in both volume and area when compared to the revised 1996 numbers. This is due to the increased accuracy of the boundary and the use of the shallow water survey vessel (not available for the October 1995 survey) to collect data nearer the shoreline and in shallow areas in the upper reaches of the lake. These data points change the way the TIN model extrapolates to the boundary in the upper elevations and accounts for these differences in area and volume. The use of the shallow water survey vessel alleviates the need to interpolate points near the shoreline, as

was the case in the 1996 report. This report will use the 1996 original numbers for comparisons of volume and area. Figure 3 compares the 2002 data set to the 1995 data set and Figure 4 illustrates the differences between the 1996 boundary and the 2002 boundary.

Another product developed from the model includes a contour map. To develop this map, the TIN was converted to a lattice using the TINLATTICE command and then to a polygon coverage using the LATTICEPOLY command. Linear filtration algorithms were applied to the DTM to produce smooth cartographic contours. The resulting contour map of the bottom surface at 2-ft intervals is presented in Figure 5.

RESULTS

Results from the 2002 TWDB survey indicate Aquilla Lake encompasses 3,020 surface acres and contains a total volume of 45,319 ac-ft at conservation pool elevation of 537.5 ft. The length of the shoreline at the digitized elevation of 537.9 ft was calculated to be approximately 48 miles. The deepest point physically measured during the survey was at elevation 493.8 ft corresponding to a depth of 43.7 ft below TOC and was located approximately 470 ft upstream of Aquilla Dam.

SUMMARY AND COMPARISONS

The Federal Flood Control Act approved September 3, 1954 and the Public Works Appropriation Act of 1958 authorized the construction of Aquilla Dam creation of Aquilla Lake. Construction commenced August 3, 1976. Deliberate impoundment began April 29, 1983. Initial storage calculations estimated the volume of the lake at the conservation pool elevation of 537.5 to be 52,400 ac-ft with a surface area of 3,280 acres.

Prior to this report, the most recent volumetric survey report on Aquilla Lake was published by the TWDB in January 1996 when the volume of Aquilla Lake was estimated to be 45,962 ac-ft with a surface area of 3,266 acres at elevation 537.5 ft.

At conservation pool elevation 537.5 ft, the current TWDB survey estimated 3,020 surface acres and reports a volume of 45,319 ac-ft of water. The capacity of the active pool (conservation storage) between elevations 537.5 ft and 503.0 ft is 45,092 ac-ft of water. The dead pool storage or that capacity of water below the invert of the lowest outlet (elevation 503.0 ft) was 227 ac-ft of water.

The 1996-revised elevation-area-capacity table indicates that Aquilla Lake had a volume of 44,462 ac-ft of water and a surface area of 2,900 acres at conservation pool elevation 537.5 ft. A comparative summary of the historical data and the results of the TWDB 2002 survey are presented in Table 2. As discussed previously, the distance between the 1996 surveyed points and the updated boundary is large enough that the TIN model underestimates the area and volume when interpolating to the boundary. Therefore, in this report the original 1996 area and volumes numbers are used for comparison.

Comparisons between original survey data (1964) and the TWDB volumetric surveys are difficult and some apparent changes might simply be due to methodological differences. It is recommended that a similar survey be performed in five to ten years or after major flood events to monitor changes to the lake's capacity.

Table 2. Area and Volume Comparisons of Aquilla Lake

	USACE Original Design 1964	TWDB Volumetric Survey 1996	TWDB Volumetric Survey 2002
Area (acres)	3,280	3,266	3,020
Total Volume (ac-ft)	52,400	45,962	45,319

Notes:

1. All pre-1996 data provided by Fort Worth District USACE
2. All results for conservation pool elevation 537.5 ft
